**Conjecture: Data
management as a cause
of technical debt**

However.....

- No mention to data in Wikipedia technical debt entry
- No explicit mention in most cited paper on technical debt according to google scholar

A systematic mapping study on technical debt and its management

AGENDA

Motivation

Our solution

Preliminary implementation

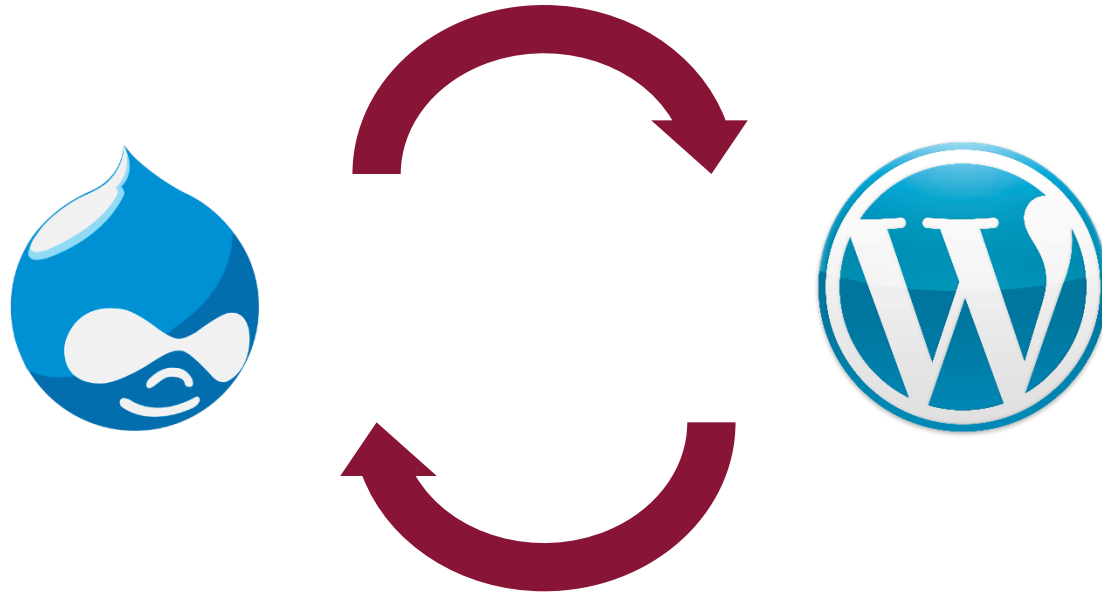

Discussion

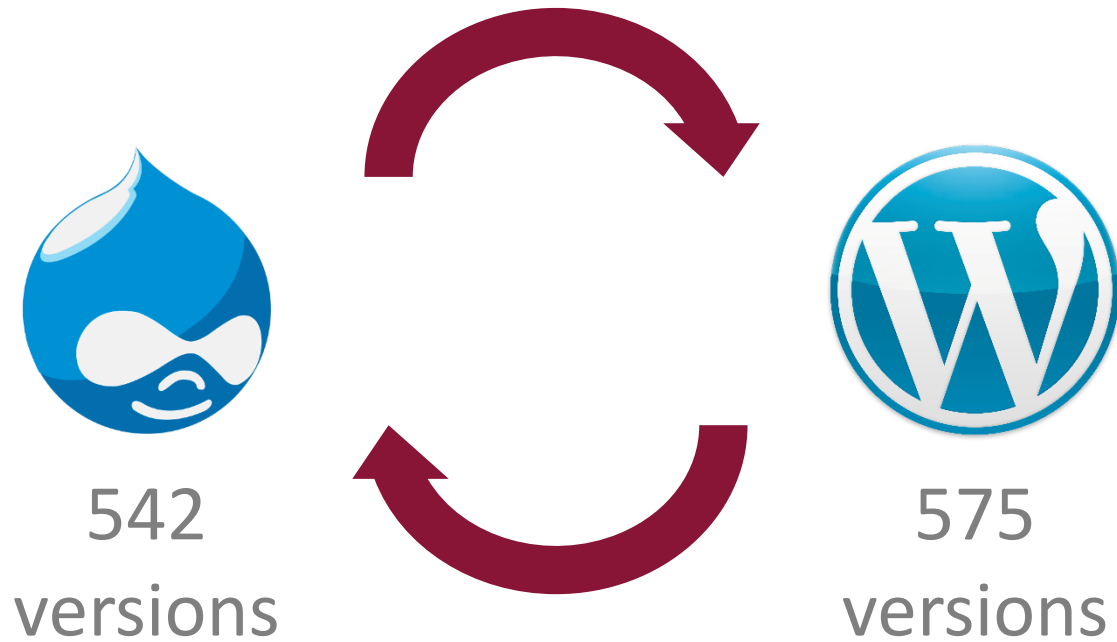

Conclusions

Motivating example

How to migrate from Drupal to WordPress and vice versa?

Motivating example

$$S = 2 \cdot V_A \cdot V_B = 2 \cdot 542 \cdot 575 = \mathbf{623.300}$$

Conjuncture

Can we use variability management techniques to face this complexity?

AGENDA

Our Goal

Our solution

Preliminary implementation

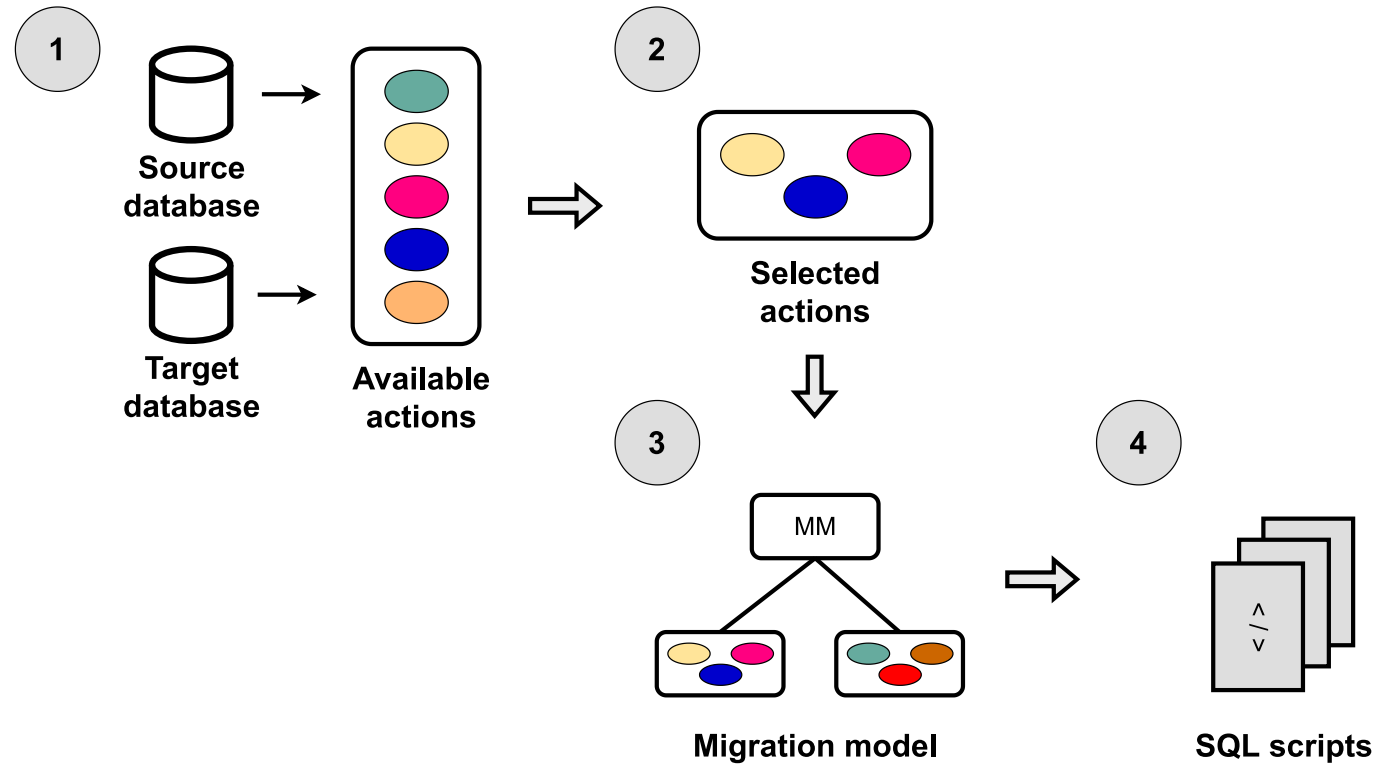

Discussion

Conclusions

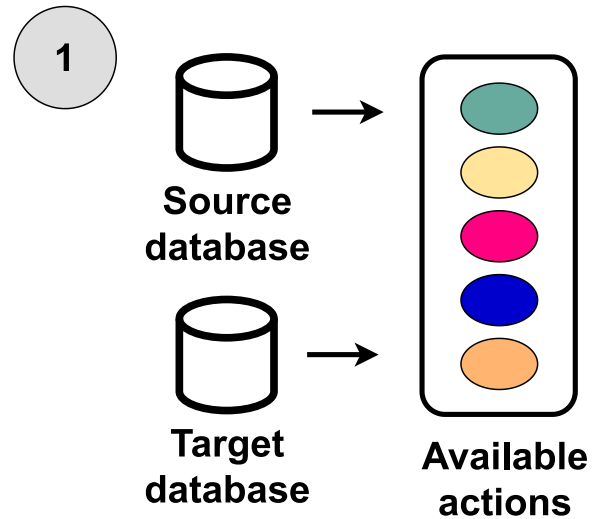

Our solution

Database transformation using a migration product line

Our solution

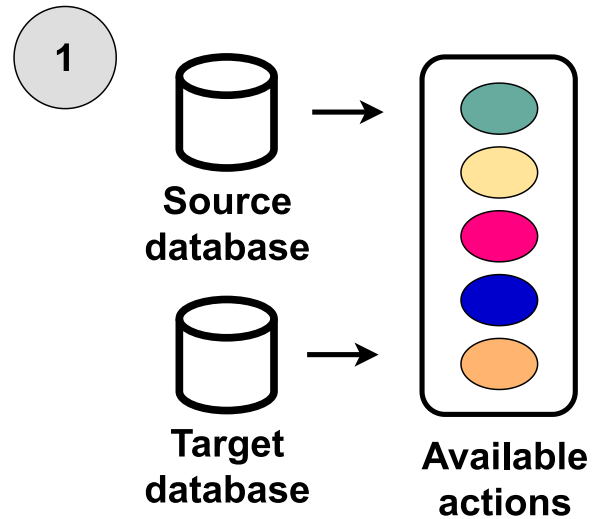

Extract simplified model

```
1 <?xml version="1.0" encoding="utf-8" standalone="yes" ?>
2 <sdm>
3
4   <entity id="post">
5     <name>Post</name>
6     <attribute>
7       <name>title</name>
8       <type>varchar(25)</type>
9     </attribute>
10    <attribute>
11      <name>body</name>
12      <type>text</type>
13    </attribute>
14  </entity>
15
16  <entity id="post_meta">
17    <name>PostMeta</name>
18    <attribute>
19      <name>author</name>
20      <type>varchar(25)</type>
21    </attribute>
22  </entity>
23
24  <relation>
25    <one id="post"></one>
26    <many id="post_meta"></many>
27  </relation>
28
29 </sdm>
```

Our solution

General actions

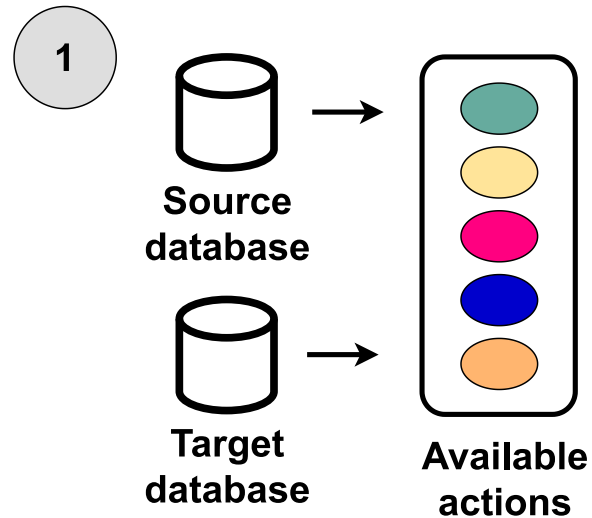

Concerning entities

- create entity
- rename entity
- delete entity

Our solution

General actions

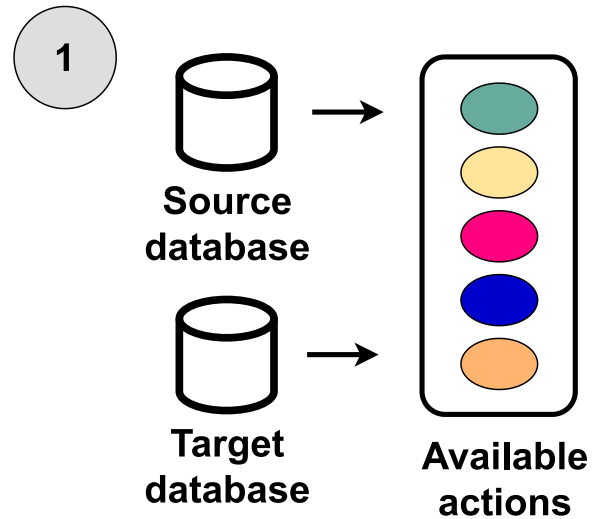

Concerning attributes

- create attribute
- move attribute
- rename attribute
- change attribute type
- delete attribute

Our solution

General actions

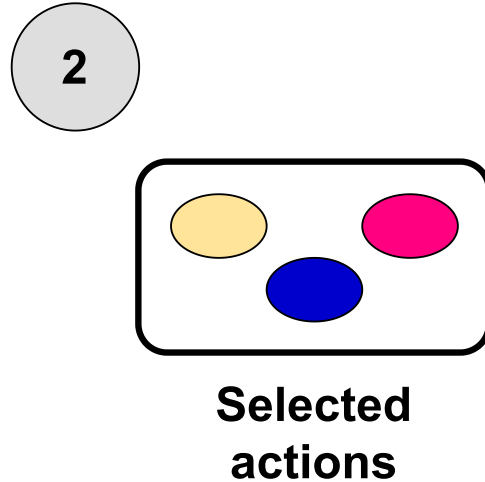

Concerning relationships

- create relationship
- remove relationship
- edit relationship

Our solution

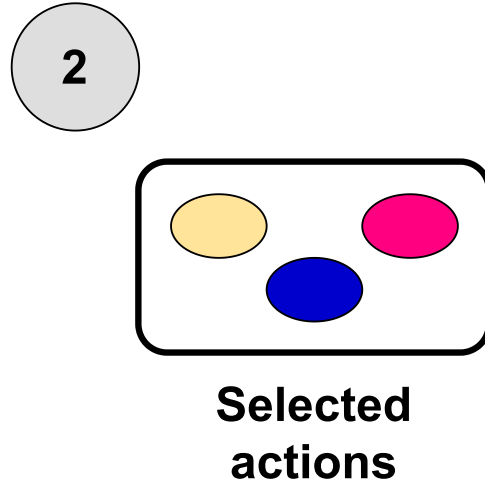

Select actions from the available ones

The selection will affect
the structure of the the
target database

Our solution

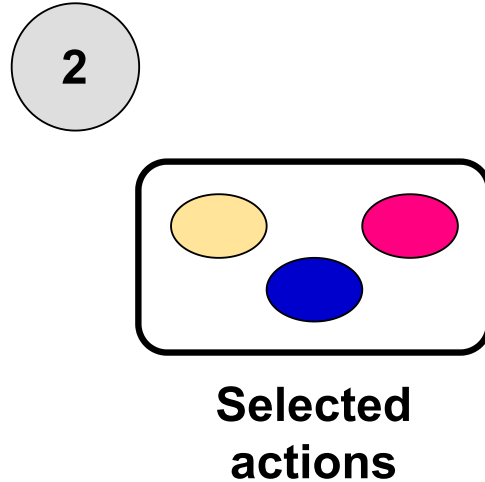

Select actions

Option 1: Manually
user selects actions via
an interactive menu

Our solution

Select actions

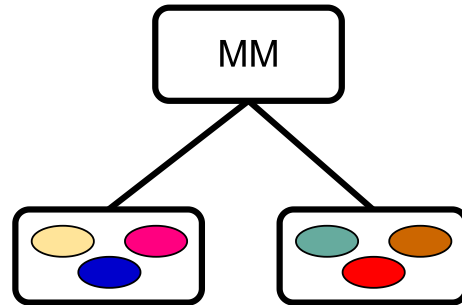

Option 2: By heuristic
fitness function: difference
between entities,
attributes and relationships

$$H = dif(E_x, E_y) + \sum_{n=1}^{|E_x|} \sum_{m=1}^{|E_y|} dif(At_n, At_m) + dif(T_n, T_m)$$

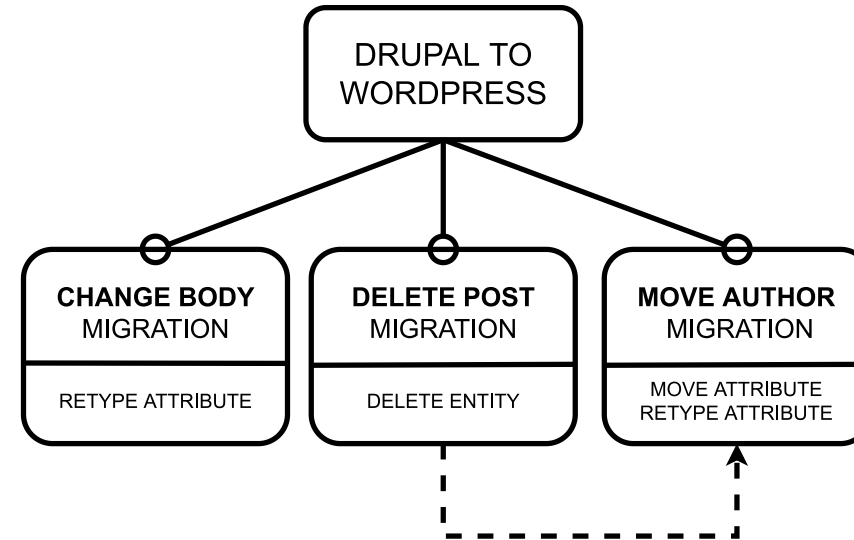

Our solution

Create the migration model

3

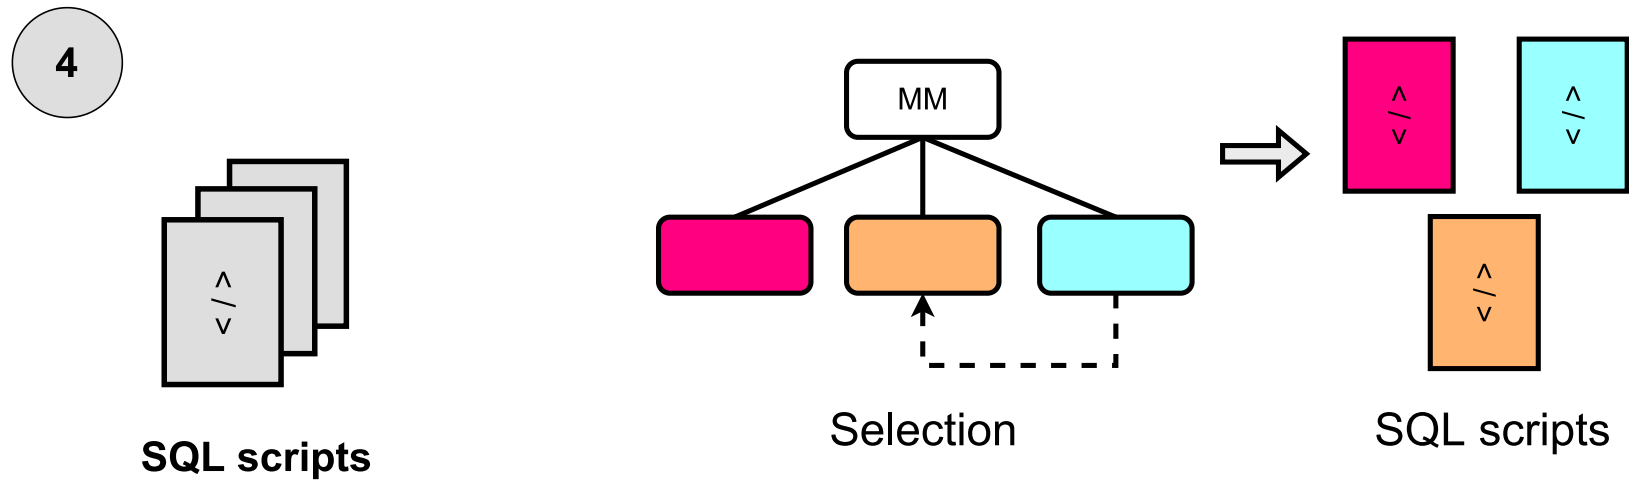

Migration model

Our solution

Generate the migration (SQL) scripts

AGENDA

Our Goal

Some methodological aspects

Preliminary implementation

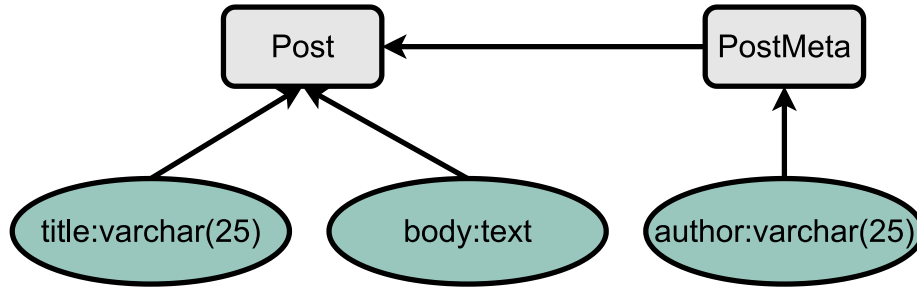

Discussion

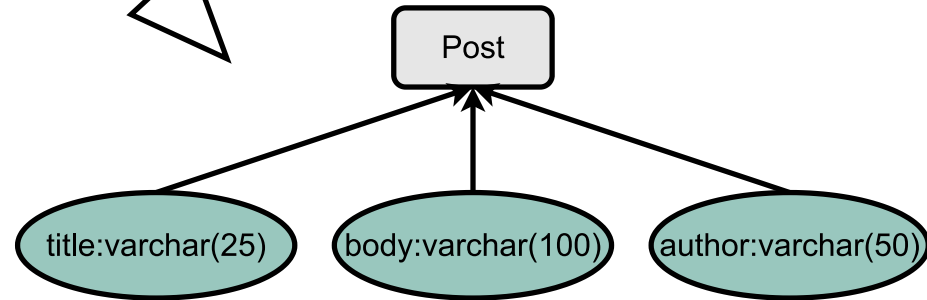

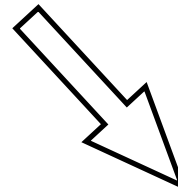

Conclusions

Implementation

An example

Drupal database

WordPress database

Implementation

Selecting actions

```
#####  
Available actions  
#####
```

6 available actions

0 -> RenameAttributeAction

rename attribute title to author in Post

1 -> RetypeAttributeAction

retype attribute body to varchar(100) in Post

2 -> MoveAttributeAction

move attribute author : varchar(25), from PostMeta to Post

3 -> CreateAttributeAction

new attribute: author : varchar(25) in entity Post

4 -> DeleteEntityAction

delete entity: post_meta

5 -> DeleteAttributeAction

delete attribute body from Post

Select an available action ('q' for quit):

Implementation

Selecting actions

```
